1. **INTRODUCTION**

This handbook identifies the crop-specific procedural requirements for adjusting Multiple Peril Crop Insurance (MPCI) losses in a uniform and timely manner. These procedures, which include crop appraisal methods and claims completion instructions, supplement the general (not crop-specific) procedures, forms, and manuals for loss adjustment identified in the Loss Adjustment Manual (LAM).

2. **SPECIAL INSTRUCTIONS**

This handbook remains in effect until superseded by reissuance of either the entire handbook or selected portions (through slipsheets or bulletins). If slipsheets have been issued for a handbook, the original handbook as amended by slipsheet pages shall constitute the handbook. A bulletin can supersede either the original handbook or subsequent slipsheets.

A. **DISTRIBUTION**

The following is the minimum distribution of forms completed by the adjuster for the loss adjustment inspection:

One legible copy to the insured. The original and all remaining copies as instructed by the insurance provider.

**NOTE:** It is the insurance provider’s responsibility to maintain original insurance documents relative to policyholder servicing as designated in their approved plan of operations.

B. **TERMS, ABBREVIATIONS, AND DEFINITIONS**

(1) Terms, abbreviations, and definitions that are **general** (not crop specific) to loss adjustment are identified in the LAM.

(2) Terms, abbreviations, and definitions **specific** to macadamia nut loss adjustment and this handbook, which are not defined in this section, are defined as they appear in the text.

***

(3) **Definition(s):**

- **Age**
  The number of complete 12-month periods that have elapsed since the month the trees were set out or were grafted, whichever is later. An age determination will be made for each unit, or portion thereof, as of January 1 of each crop year.

- **Block**
  A portion of the orchard where trees are of the same size (age), variety, maturation date, etc.
Direct Marketing
Sale of the insured crop directly to consumers without the intervention of an intermediary such as a wholesaler, retailer, packer, processor, shipper or buyer. Examples of direct marketing include selling through an on-farm or roadside stand, farmer’s market, and permitting the general public to enter the orchard for the purpose of picking all or a portion of the crop.

Floaters
Inedible, husked “field run” nuts identifiable by water floatation.

Graft
The uniting of a macadamia shoot to an established macadamia tree rootstock for future production of macadamia nuts.

Harvest
Picking of mature macadamia nuts from the ground.

Husking
Removal of the outer layer (husk or exocarp) revealing the wet in-shell nut.

Peeees
Mature and immature wet in-shell nuts that are smaller than the acceptable size for processing.

Rootstock
The root and stem portion of the macadamia tree to which a macadamia shoot can be grafted.

Top-worked
A tree that has branches with different varieties of the same nut variety grafted onto the scaffold branches of the tree.

Wet in-husk
The weight of in-husk macadamia nuts as they are removed from the orchard that includes immature and unsound nuts (floaters and peewees) prior to drying.

Scaffold Branches
The main branches connected to the tree trunk that form the framework of the tree.

Sound Wet in-shell
The weight of the macadamia nuts as they are removed from the orchard, with the nut meats in the shells, after removal of the husk but prior to being dried. Excludes immature and unsound nuts (floaters and peewees). This is the weight used for Actual Production History (APH) and claims purposes.

3. INSURANCE CONTRACT INFORMATION
The insurance provider is to determine that the insured has complied with all policy provisions of the insurance contract. Crop provisions which are to be considered in this determination include (but are not limited to):
A. **INSURABILITY**

(1) The crop insured will be all macadamia nuts in the county, in which the insured has a share, for which a premium rate is provided by the actuarial documents, and:

   (a) That are grown on tree varieties that:

       1. Were commercially available when the trees were set out;

       2. Are adapted to the area; and

       3. Are grown on rootstock that is adapted to the area.

   (b) That are grown in an orchard that, if inspected, is considered acceptable by the insurance provider;

   (c) That are grown on trees that have reached at least the fifth growing season after being set out or grafted. However, the insurance provider may agree in writing to insure acreage that has not reached this age if it (acreage) has produced at least 200 pounds of (wet in-shell) macadamia nuts per acre in a previous year; and

   (d) That are produced from blooms that normally occur during the calendar year in which insurance attaches and that are normally harvested prior to the end of the insurance period.

(2) Insured Acreage: Macadamia acreage interplanted with another perennial crop is insurable unless the insurance provider inspects the acreage and determines that it does not meet the requirements contained in the policy.

(3) Causes of Loss: Refer to the crop provisions for specific insured causes of loss. Refer to the Basic Provisions and the crop provisions for causes of loss that are excluded.

B. **PROVISIONS NOT APPLICABLE TO CAT COVERAGE**

(1) Optional Units.

(2) Written Agreements

(3) Hail and Fire Exclusion provisions. (also not applicable if additional coverage is less than 65/100 or comparable coverage).

(4) High Risk Land Exclusion.

**NOTE:** Refer to the Crop Insurance Handbook (CIH) and Loss Adjustment Manual (LAM) for other provisions not applicable to CAT.

C. **UNIT DIVISION**

Refer to the insurance contract for unit provisions. Unless otherwise allowed by written agreement, optional units may be established only if each optional unit:

(1) Contains at least 80 acres of bearing macadamia trees; or
(2) Is located on non-contiguous land.

4. MACADAMIA NUT APPRAISALS

A. GENERAL INFORMATION

Potential production will be appraised in accordance with procedures specified in this handbook and the LAM.

B. SELECTING REPRESENTATIVE SAMPLES FOR APPRAISALS

Determine the number and general location of trees to be used in the representative sample based on:

(1) Total insured acreage listed in the Summary of Coverage and number of trees in the unit and/or sub-orchard in the unit.

*** (2) Extent of variation in the amount of production or damage within the acreage.

NOTE: When variable damage causes the crop potential to be significantly different within the same orchard, or when the insured wishes to destroy or not harvest a portion of the orchard, split the orchard into sub-orchards and appraise each one separately.

(3) Percent of each variety in the acreage.

(4) Tree age, size, density, and vigor.

***

(5) Take not less than the minimum number (count) of representative samples required in TABLE A.

***

5. APPRAISAL METHODS

A. GENERAL INFORMATION

These instructions provide information on appraisal methods for:

B. **NUT WEIGHT APPRAISALS**

(1) **General Information:**

(a) Verify all acreage and nut variety(ies) to be appraised with the Summary of Coverage.

(b) Since macadamia nuts are harvested several times during the insurance period, determine the insured’s harvest schedule and normal harvest dates.

(c) When an insured reports damage, appraisals may be required for each applicable normal harvest date. Multiple appraisals may be needed to determine the amount of appraised potential production on the unit for the current crop year.

(d) Select representative sample trees using the criteria in subsection 4 B.

(e) Make arrangements with the insured to harvest nuts from the ground under sample trees as the crop reaches maturity.

(f) Use a Special Report or other applicable form to document the row and tree number of each sample tree. This is necessary to assure the adjuster returns to the same sample trees to determine appraised potential production for each succeeding appraisal during the crop year.

(g) Tally all appraisals from all sample trees to calculate the unit appraisal.

(2) **Appraisal Method:**

(a) Collect all harvestable wet in-husk nuts on the ground under each sample tree. In orchards where trees are in close proximity, select only those nuts that are within the drip line of the sample tree canopy.

(b) Record the weight of wet in-husk nuts from each sample tree in column 15 on the appraisal worksheet.

(c) Total the weight of all wet in-husk sample nuts and record weight in column 16 on the appraisal worksheet.

(d) Husk all wet in-husk sample nuts. Weigh the husked nuts and record the gross wet in-shell weight in column 17 on the appraisal worksheet.

(e) Remove peewees (undersized nuts) and trash. Then, use a bucket of water to “float” the gross wet in-shell nuts. Remove all un-sound nuts (floaters). The remaining nuts are sound wet in-shell nuts. Weigh the sound wet in-shell nuts and record the weight in column 18.

(f) Divide the weight of the sound wet in-shell nuts by the number of samples to calculate the average pounds of sound wet in-shell nuts per tree.
(g) Multiply the weight of sound wet in-shell nuts by the number of bearing trees in the orchard or suborchard to calculate the total pounds of sound wet in-shell nuts.

(h) Tally individual appraisals on the summary sheet. After the last harvest, tally all summary sheet totals to calculate the unit appraisal.

C. HARVESTED APPRAISALS

*** Use this method only when harvested acreage can be verified representative of unharvested acreage. This is done by actually inspecting the harvested and unharvested acreage prior to any harvest to compare the nut crop on the ground under the trees. Document such inspections in the “Narrative” section of the claim form or on a Special Report.

(1) Prior to harvest, the insured must notify the insurance provider of any damaged macadamia nut production so the insurance provider can inspect and verify the damaged production.

(2) Divide harvested production by the number of harvested acres to calculate the harvested yield per acre.

(3) Document such inspections and calculations in the “Narrative” section of the claim form or on a Special Report.

6. APPRAISAL DEVIATIONS AND MODIFICATIONS

A. DEVIATIONS

Deviations in appraisal methods require FCIC written authorization (as described in the LAM) prior to implementation.

B. MODIFICATIONS

There are no pre-established modifications contained in this handbook. Refer to the LAM for additional information.

7. APPRAISAL WORKSHEET ENTRIES AND COMPLETION PROCEDURES

A. GENERAL INFORMATION

(1) Include the insurance provider’s name in the appraisal worksheet title if not preprinted on the insurance provider’s worksheet or when a worksheet entry is not provided.

(2) Include the claim number on the appraisal worksheet (when required by the insurance provider) when a worksheet entry is not provided.
(3) Separate appraisal worksheets are required for each unit, variety, and sub-orchard, as applicable. Refer to section 4 B for sampling requirements. If the insured does not know the name of the variety(ies) in the orchard, combine all unknown variety(ies) into an “All Variety” worksheet.

NOTE: Standard appraisal worksheet items are numbered consecutively in subsection 7 B. An example appraisal worksheet is also provided to illustrate how to complete entries.

8. CLAIM FORM ENTRIES AND COMPLETION PROCEDURES

A. GENERAL INFORMATION

(1) The claim form (hereafter referred to as a “Production Worksheet”) is a progressive form containing all notices of damage for all preliminary and final inspections on a unit.

(2) If a Production Worksheet has been prepared on a prior inspection, verify each entry and enter additional information as needed. If a change or correction is necessary, strike out all entries on the line and re-enter correct entries on a new line. The adjuster and insured should initial any line deletions.

(3) Refer to the LAM for instructions regarding the following:
   
   (a) Acreage report errors.
   
   (b) Delayed notices and delayed claims.

For spacings not shown on the chart: Multiply the distance between plants (nearest tenth of a foot) times the distance between rows (nearest tenth of a foot) and divide the result into 43,460 sq. ft. per acre (rounded to nearest whole number).

**EXAMPLE:** 6.5 ft. x 10 ft. = 65 sq. ft.
43,560 sq. ft. per acre ÷ 65 sq. ft. = 670 trees per acre
