ALMOND LOSS
ADJUSTMENT STANDARDS
HANDBOOK
2008 and Succeeding Crop Years
THIS HANDBOOK CONTAINS THE OFFICIAL FCIC-ISSUED LOSS ADJUSTMENT STANDARDS FOR THIS CROP FOR THE 2008 AND SUCCEEDING CROP YEARS. ALL REINSURED COMPANIES WILL UTILIZE THESE STANDARDS FOR BOTH LOSS ADJUSTMENT AND LOSS TRAINING.

SUMMARY OF CHANGES/CONTROL CHART

The following list contains the significant changes to this handbook, as determined by us. It may not represent all changes made. All changes made to this handbook are applicable regardless of whether or not listed.

Major Changes: See changes or additions in text which have been highlighted. Three asterisks (***), indicate where information has been removed.

A. Updated section 3. A. (c) to reflect changes in the Almond Crop Provisions.
C. Revised language in section 5.B. (3).
D. Revised language in section 5. B. (5) to show the result of the calculation to be average pounds of nuts per tree.
E. Inserted language in sections 7. C. 16, 7. C. 23. (c) and (d) for determined tree spacing.
F. Updated Tables A, B, C, and D.

A. **INSURABILITY**

The following may not be a complete list of insurability requirements. Refer to the Basic Provisions, Almond Crop Provisions, and Special Provisions for a complete list.

(1) The crop insured will be all almonds in the county for which a premium rate is provided by the actuarial documents in which the insured has a share:

   (a) That are grown for harvest as almonds;

   (b) That are irrigated; and

   (c) That are grown on acreage where at least 90 percent of the trees have reached at least the sixth growing season after set out, unless otherwise provided in the Special Provisions.

(2) Almonds interplanted with another perennial crop are insurable unless the AIP inspects the acreage and determines the (acreage) does not meet the requirements contained in the insured’s policy.

(3) Insurance coverage is provided against damage or loss from insects or disease but not damage due to insufficient or improper application of pest and disease control measures.

(4) Insurance coverage is provided against damage or loss from wildlife, unless control measures have not been taken.

(5) Insurance coverage is not provided against damage or loss of production due to the inability to market the almonds for any reason other than actual physical damage to the almonds from an insurable cause specified in the crop provisions.

B. **PROVISIONS AND PROCEDURES NOT APPLICABLE TO CAT COVERAGE**

Refer to the Crop Insurance Handbook (CIH) and LAM for other provisions and procedures not applicable to CAT.

C. **UNIT DIVISION**

Refer to the insurance contract for unit provisions. Unless limited by the Crop or Special Provisions, a basic unit, as defined in the Basic Provisions, may be divided into optional units if, for each optional unit, all conditions stated in the applicable crop provisions are met.
4. **ALMOND APPRAISALS**

A. **GENERAL INFORMATION**

(1) Potential production for all types of inspections will be appraised in accordance with procedures specified in this handbook and the LAM.

(2) Make separate appraisals for each almond variety grown in the orchard, as applicable.

(3) Within the policy provisions is a requirement that insureds file a “notice of damage or loss.” If the insured intends to claim an indemnity on any unit, the insured must notify the AIP prior to the beginning of harvest so that the AIP may inspect the damaged production. The insured must not sell or dispose of the damaged crop until after the AIP has given written consent to do so. If the insured fails to meet the requirements of the crop provisions, all such production will be considered undamaged and included as production to count. Refer to the Basic Provisions, the Crop Provisions, and the LAM for more information on “notices of damage or loss.”

(4) Appraise almonds, when required, after the nut drop period but before any nuts are removed from the trees.

B. **SELECTING REPRESENTATIVE SAMPLES FOR APPRAISALS**

(1) Make a general examination of all acreage in the orchard. Determine the number and general location of trees to be used in the representative sample based on:

   (a) Total acreage and number of trees;

   (b) Extent of variation in the amount of production or damage within the acreage. When variable damage causes the crop potential to be significantly different within the same orchard, or when the insured wishes to destroy a portion of the orchard, split the orchard into sub-orchards, and appraise each one separately.

   (c) Percent of each variety in the acreage;

   (d) Tree age, size, density, and vigor; and

   (e) The acreage in the unit from which nuts have been harvested and the extent of variation in the amount of unharvested nuts on the trees.

(2) Take not less than the minimum number (count) of representative samples required in TABLE A for each orchard or sub-orchard.

(3) The Random Path Appraisal Method (RPAM) may be used at the discretion of the AIP to appraise the almond crop production. Use the RPAM method in lieu of appraisal methods in this handbook, as applicable.
C. **ORCHARD APPRAISALS**

Determining Variety Acreage for Appraisals:

1. Appraisals must take into consideration the planting pattern, variety mix, and the number of acres of each variety in the orchard or sub-orchard.

2. Use the formula below to determine the percent acreage for each variety provided that the row length and planting patterns are the same for all varieties being appraised.

**FORMULA:**

\[
\text{Percent Variety in Unit or Plot, Round to Nearest Whole Percent} = \frac{\text{Number of Rows Planted to a Single Variety}}{\text{Total Rows in the Planting Pattern}}
\]

**EXAMPLE:**

A 20.0 acre orchard is planted to three varieties (Variety 1, Variety 2, and Variety 3) in a four row pattern (1-1-1-1). The first row is Variety 1, the second and fourth rows are Variety 2, and the third row is Variety 3. Variety distribution is as follows:

- Variety 1 = 1 row ÷ 4 rows = .25 or 5.0 acres
- Variety 2 = 2 rows ÷ 4 rows = .50 or 10.0 acres
- Variety 3 = 1 row ÷ 4 rows = .25 or 5.0 acres

D. **HANDLING APPRAISAL DISCREPANCIES**

If the insured disagrees with the appraisal, make arrangements for leaving representative trees UNHARVESTED and for inspecting those trees when the almonds are ready to harvest (harvest-appraisal). The adjuster and insured should jointly determine the trees to be selected for this representative sample. Make a sketch map of the orchard and mark the sample trees by row number and tree count within the chosen row. An adjuster must be present when the representative trees are harvested.
5. APPRAISAL METHODS

A. GENERAL INFORMATION

These instructions provide information on appraisal methods for:

<table>
<thead>
<tr>
<th>Appraisal Method.....</th>
<th>Use....</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nut Count Appraisals</td>
<td>to appraise nuts on the tree prior to harvest that are taken from representative sample trees.</td>
</tr>
<tr>
<td>Representative Tree Appraisals</td>
<td>the production from representative trees to determine the appraisal.</td>
</tr>
<tr>
<td>Harvested Acreage Appraisals</td>
<td>the average yield per acre from harvested acreage as the appraisal per acre for unharvested acreage.</td>
</tr>
</tbody>
</table>

B. NUT COUNT APPRAISAL METHOD

(1) Use the Fig/Nut Tree Appraisal Worksheet to record nut counts taken from sample trees (refer to section 4 B for sampling requirements).

(2) Determine the percent of each variety for the acreage being appraised.

(3) By variety, count the total number of nuts on the sample trees (include nuts damaged by uninsured causes), and record nut counts on the Fig/Nut Tree Appraisal Worksheet.

(4) Total the number of nuts from all sample trees and divide by the number of trees in the sample.

(5) Multiply the result from (4) above by the nut size factor (from TABLE B) for the variety being appraised to determine the average pounds of nuts per tree.

(6) Next multiply by the number of bearing trees per acre to determine the number of whole pounds of nuts per acre for the variety.

(7) If more than one variety is in the acreage being appraised, multiply the number of whole pounds of nuts per acre for each variety by the percent determined in (2) above to determine the number of whole pounds of nuts per acre by variety.

(8) Add the number of pounds of nuts per acre for all varieties to determine the appraised number of whole pounds of nuts per acre. Transfer the appraisal per acre to column “J” or “M,” as applicable, on the Production Worksheet (refer to section 8 below).
8. **Variety:** Variety name of trees in the acreage being appraised.

9. **Acres:** Number of determined acres to tenths for the variety being appraised.

10. **Number of Figs/Nuts per Tree:** Number of nuts from each sample tree (include nuts damaged by uninsured causes). If necessary, use additional lines to record nut counts for all sample trees. Document in the Remarks the number of nuts per tree damaged by uninsured causes.

11. **Total Figs/Nuts all Trees:** Total nuts from item 10 from all sample trees.

12. **Number Trees in Sample:** Total number of sample trees.

13. **Average Figs/Nuts Tree:** Item 11 divided by item 12, whole nuts.

14. **Figs/Nuts Lb. for Variety:** The number of nuts per pound (refer to TABLE B).

15. **Average Pounds per Tree:** Item 13 divided by item 14, to two decimal places.

16. **Bearing Trees per Acre:** Determine the tree spacing for the variety and enter the number of bearing trees per acre from Table C. Enter the tree spacing in Remarks (refer to TABLE C).

17. **Figs/Nuts Pounds per Acre:** Item 15 times item 16, in whole pounds.

18. **Reject Factor:** MAKE NO ENTRY.

19. **Net Nut Lbs. per Acre:** MAKE NO ENTRY.

20. **% Acres for Variety:** Item 9 divided by item 5, to two-decimal places (refer to subsection 4C for more information).

21. **Figs/Nut per Acre for Variety:** Item 17 times item 20, in whole pounds.

22. **Appraisal (Lbs./A.):** Total of all item 21 entries, in whole pounds.

23. **Remarks:** Document the following on the appraisal worksheet or on a Special Report:

   a. Acreage determinations for items 5 and 9;

   b. Any uninsured causes, the number of nuts per tree damaged by such causes and show any calculations; and

   c. Determined tree spacing.

   d. Any other pertinent information about the appraisal.
The following required entries are not illustrated on the appraisal worksheet example below.

24. **Insured's Signature and Date:** Insured’s (or insured’s authorized representative’s) signature and date. BEFORE obtaining the signature, REVIEW ALL ENTRIES on the Appraisal Worksheet WITH THE INSURED (or insured’s authorized representative), particularly explaining codes, etc., which may not be readily understood.

25. **Adjuster's Code Number, Signature, and Date:** Signature of adjuster, code number, and date after the insured (or insured’s authorized representative) has signed. If the appraisal is performed prior to the signature date, document the date of appraisal in the Remarks section of the Appraisal Worksheet (if available); otherwise, document the appraisal date in the Narrative section of the Production Worksheet.

**Page Number:** Page numbers - (Example: Page 1 of 1, Page 2 of 2, etc.).

* Use this Table for square or hedge plantings. To determine number of trees per acre for tree spacing not shown above, multiply the distance between trees in the row, in feet to tenths, by the distance between rows, in feet to tenths, and divide the result (in feet to tenths) into 43,560 sq. ft./acre (round to nearest whole number). **EXAMPLE:** 30.5 ft X 36.0 ft = 1098.0 sq. ft. 43,560 sq. ft ÷ 1098.0 sq. ft. = 39.67 or 40 trees/acre. To determined number of trees per acre for other tree planting patterns (e.g., hexagonal, quincunx, etc.) refer to the LAM.

Some almond processors take samples from deliveries for varieties that are typically sold inshell. These samples are cracked out to determine the actual shelling percent for the variety. The shelling percentage from the sample crack out is used to determine the payment per pound for the variety being sold inshell and is shown on the settlement sheet. In this situation, use the shelling percentages shown on the settlement sheet as the shelling percent entry on the claim form.
EXHIBIT 1
APPRAISALS FOR FAILURE TO USE RECOMMENDED NUMBER OF BEEHIVES FOR PROPER POLLINATION

Losses due to failure to use an adequate number of beehives for pollination is not an insurable cause of loss. In situations where no insurable cause of loss is evident, the adjuster must determine the number of hives set out by the producer. If it is determined that the producer set out less than the number of hives recommended by crop experts, the loss adjuster should verify the number of hives the producer used to establish the APH yield for the unit. The loss adjuster should review receipts for hive rentals for at least one non-loss year. If no documentation is available, use the number of hives recommended by experts (which is a minimum of two hives per acre) and assess uninsured causes of loss.

If the adjuster determines there are both insured causes of loss (rain and cool weather, etc.) and uninsured causes (e.g., lack of adequate beehives, etc.), refer to the LAM, Part 4, Unusual/Controversial Cases, Controversial Claim.

EXAMPLE:

Assume the insured has 100% share in one unit of Almonds with a 75% coverage level. The APH yield for this unit is 1600 pounds per acre. The insured has a guarantee of 1200 pounds per acre (.75 coverage level X 1600 lbs.). Historically the insured uses 2.5 hives per acre. However, for this crop year, the insured used only one hive per acre which is less than the minimum number of two hives per acre recommended by experts.

Assume for this crop year, the insured harvests 250 pounds of Almonds per acre. Surrounding farms with the same variety and adequate hives report an average production of 50% of normal yield due to insurable causes of loss. The insured provides hive rental receipts for the previous year that support the use of 2.5 hives per acre.

The adjuster must determine what the production would have been with an adequate number of hives.

1600 lbs. APH yield X .50 average production from surrounding farms for the year = 800 lbs. The 800 lbs. represents the pounds the insured should have produced if an adequate number of hives were used considering the insured causes of loss that occurred.

800 lbs. – 250 lbs harvested = 550 lbs. production lost due to failure to use adequate number of hives. Therefore, 250 lbs. harvested + 550 lbs. lost production = 800 lbs. total production to count.

Enter 550 lbs. in Section I, column “M” of the Production Worksheet as an uninsured cause of loss appraisal.

Document in the Narrative of the Production Worksheet or on a separate Special Report how the appraisal was determined.
